

# DruvStar – The Gaming Industry’s Choice for Information Security

DRUVSTAR

## 7 Ways that DruvStar’s MDR Solves Your Cybersecurity Challenges

Savvy CISOs and IT leaders know what they need to do to build out a robust security posture, but so many businesses don’t have the resources or bandwidth to do what it takes to get there. MDR (Managed Detection and Response) solutions are becoming so popular because they solve this problem with lower investment, and result in faster deployments with elevated levels of protection.

Risks come from inside and outside the property: IoT devices, Wi-Fi, room connections (network, phones, and entertainment), phishing, zero-day vulnerabilities, employee behaviors, misconfiguration, innocent oversight, and employees working from home. The Managed Detection and Response service from DruvStar correlates, monitors, and protects across all these attack surfaces.

**DruvStar’s MDR solution solves many of the key challenges that IT leaders face when endeavoring to build the internal capabilities to step up to this next generation of cyber-protection.**

### CHALLENGE

### SOLUTION

COST

24x7 staffing, tooling, training, and storage. This quickly gets into 7 figures, meaning only the largest businesses can absorb this burden. For many IT departments, even asking for one or two incremental heads can be a challenge.

DruvStar provides 24 x 365 coverage, market leading technology, and storage for threat hunting and RCA at a fraction of the cost to build an in-house solution. Cybersecurity is a Business Continuity need which requires incremental investment while maximizing risk protection.

TOOLS

Purchasing tools to align with checklists yields complexity and creates tooling overlap and coverage gaps. Hiring and training staff to manage, configure, and reap maximum value from the chosen tools increases costs. This drives underutilized assets and open vulnerabilities.

DruvStar’s team are experts in security tooling, some of which you may already be running. We will evaluate your technology stack and propose improvements where needed: uncovering duplication of tool capabilities, exposing gaps, and identifying opportunities for consolidation.

## CHALLENGE

## SOLUTION

### THREATS

Without a dedicated security team, keeping up with the onslaught of new threat information is impossible to manage. Important security tasks fall to a lower priority against the day-to-day activities of running your business.

DruvStar has integrated with nearly a dozen leading threat intelligence sources, and our SOC team continually monitor multiple cybersecurity news feeds for the latest threats: checking environments and updating tooling to sniff out each one as they are identified.

### SUPPORT

Simply installing a security solution isn't enough, even if that solution is touted as AI. They need to be maintained, trained, and monitored. Despite the publicity, AI-only solutions still don't provide the coverage offered by live professionals

AI provides an additional layer of input to the threat hunting process, and DruvStar's solutions make the most of this. But DruvStar's trained eyes are also required to dig deeper, validate alerts, hunt down the bad guys, and take the necessary steps for complete recovery.

### FATIGUE

When managing your own security posture, the continuous events, alerts, and false positive incidents can begin to wear on your team, allowing issues to slip by undetected, and leaving systems vulnerable when a real attack occurs.

DruvStar manages 5 billion events per month, thousands of investigations, yet calls out only true positives. We continually optimize to eliminate noise and focus on specific indicators of compromise, so when we alert a customer, they know that the incident is genuine.

### TIME

Understanding the problem, quantifying the solutions, budget approvals, RFPs, vendor due diligence, training staff, deploying, configuring, and understanding the output all contribute to an extended implementation timeline that can sometimes be measured in years.

DruvStar goes from zero to a fully deployed, configured, trained and alerting system in just four weeks. Making the small changes required to greatly improve your security posture begins within just a few days of your engagement.

### PEOPLE

There are very few trained cybersecurity resources available to hire. Even if you do acquire a skilled resource, it is hard for them to maintain their capabilities when not defending against a continuous broad range of attacks.

DruvStar's teams continually deal with a high volume of global and diverse attacks across multiple businesses. This collaboration builds a well-rounded security minded environment. Training, certifications, and purple-team exercises contribute to security excellence in the group.

**There are very few operators in the Gaming industry with the scale to justify building out an in-house solution, and there's only one cybersecurity provider with the hands-on gaming experience required to truly understand your needs. DruvStar has over 100 years of combined gaming experience on the team.**

#### **We understand:**

- Your regulatory concerns and needs.
- The need for strict access policies.
- The need to run solutions on-prem, and the desire to be in the cloud.
- The cloud digital transformation.
- Areas of vulnerability and risk.
- The need to be able to work directly with your security provider.
- We don't install and walk away.

**Talk to DruvStar and let our MDR solution be your security solution. Schedule a live demonstration today!**
